DETAILED ACTION

Claim Rejections - 35 USC § 102

1. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

2. Claim 1, 3 and 5 are rejected under 35 U.S.C. 102(b) as being anticipated by Tajima et al. U.S. Patent No. 5,432,644.

Tajima disclose a an inner rotor (6) use in a disk drive unit comprising a rotor (6) which include a plurality of magnetic poles arranged circumferentially and a stator which is positioned outside a circumference of the rotor, has a core which include a plurality of magnetic poles teeth (9A) which face the rotor (6) in an opposed manner and arranges coil (10) on respective magnetic pole teeth (9A), wherein pitches of the magnetic pole teeth in a rotor circumferential direction along which respective rotor facing surface of the magnetic pole teeth are arranged set smaller than pitches of the rotor in the rotor circumferential direction along which the magnetic pole of the rotor are arranged (see fig. 4). The stator poles teeth (9A) are arranged within 180° with respect to a center angle of the rotor.

3. Claim 1 and 2 are rejected under 35 U.S.C. 102(b) as being anticipated by Kurauchi et al. U.S. Patent No. 4,769,567.

Kurauchi disclose an inner rotor (4) comprising a rotor (6) which include a plurality of magnetic poles arranged circumferentially and a stator which is positioned outside a circumference of the rotor, has a core which include a plurality of magnetic poles teeth (2) which

face the rotor (4) in an opposed manner and arranges coil (5) on respective magnetic pole teeth (2), wherein pitches of the magnetic pole teeth (2) in a rotor circumferential direction along which respective rotor facing surface of the magnetic pole teeth (2) are arranged set smaller than pitches of the rotor in the rotor circumferential direction along which the magnetic pole of the rotor are arranged. The pitches of the rotor (Pr) in the rotor circumferential direction along which the magnetic poles of the rotor are arranged are set 1.5 times greater than the pitches of the magnetic pole teeth (Ps) in the rotor circuit eventual direction along which respective rotor facing surfaces are arranged.

4. Claim 1 and 4 are rejected under 35 U.S.C. 102(b) as being anticipated by Takahata et al. JP Patent No. JP 2002-272023A.

Takahata disclose an inner rotor (12) comprising a rotor (12) which include a plurality of magnetic poles (14) arranged circumferentially and a stator which is positioned outside a circumference of the rotor, has a core which include six magnetic poles teeth (4) which face the rotor (12) in an opposed manner and arranges coil (8A) on respective magnetic pole teeth (4), wherein pitches of the magnetic pole teeth (4) in a rotor circumferential direction along which respective rotor facing surface of the magnetic pole teeth (4) are arranged set smaller than pitches of the rotor in the rotor circumferential direction along which the magnetic pole of the rotor are arranged.
